Pred. No. is the number of results score greater than or equal to the predicted by chance to have a score of the result being printed,

and is derived by analysis of the total score distribution.

Result No.

Nicotiana tabacum phytoene synthase coding sequence #1.

plant growth regulator; herbicidal; tobacco; ss. Phytoene synthase; zeta carotene desaturase; herbicide; transgenic plant;

Nicotiana tabacum.

CDS Location/Qualifiers 244..1566

No.:
                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of phytoene synthases and zeta-carotene desaturase from Nicotiana tabacum. The sequences can be used to identify compounds capable of altering the expression of these genes, which are therefore useful as plant growth regulators and herbicides. They can also be used to produce transgenic plants. The present sequence is the coding sequence of a tobacco
                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and/or total carotenoid contents in transgenic plant cells, plants or other host cells or organisms (e.g. algae) by inhibiting the endogenous zeaxanthin epoxidase (ZEP) activity. The invention also discloses transgenic plant cells or plants, their harvested products, replicative material (protoplasts, calli, seeds, tubers and cuttings) and descendants, produced by the novel method. The method is used to increase production of zeaxanthin and total carotenoids (including the therapeutic antioxidant alpha-tocopherol) for food supplementation. This sequence represents a polynucleotide corresponding to the tobacco (Nicotiana tabacum) phytoene synthase (Pys) gene which is used to describe the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1573
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    19-JUN-2001; 2001EP-0114661
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WO2002103021-A2

                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes the phytoene synthetase from Nicotiana tabacum. The phytoene synthetase coding sequence represents a CDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorber and other carotenoids have been used as food colours, animal feeds and in the pharmaceutical and cosmettics industries.

The sequences can be used to identify compounds capable of altering the expression of these genes, which are therefore useful as plant growth regulators and herbicides. They can also be used to produce transgenic plants. The present sequence is the coding sequence of a tobacco
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding tobacco zeta-carotene desaturase, useful screening compounds with herbicidal activity -

                                                                                                                                                                                             US-09-847-081B-2
                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes the phytoene synthetase from Nicotiana tabacum. The phytoene synthetase coding sequence represents a cDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorband other carotenoids have been used as food colours, animal feeds and the carotenoids have been used as food colours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding tobacco phytoene synthase polypeptides - useful producing recombinant polypeptides or transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Della-Cioppa GR,

                                                                 US-09-847-081B-2 (1-440)
                                                                                                                                                                                                                                                                                         This sequence encodes the phytoene synthetase from Nicotiana benthamiana. The phytoene synthetase coding sequence represents a cDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorber and other carotenoids have been used as food colours, animal feeds and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Phytoene synthase; transgenic plant; ultra violet absorber; food colour;

```

```
The sequence encodes melon phytoene-synthase (MEL5 gene), and is almost full-length. The sequence has been isolated as a cDNA clone from a rispening-related cDNA library derived from climacteric melon fruit, using the tomato phytoene-synthase cDNA (TOM5) as a heterologous probe. The MEL5 gene 5'-end has also been isolated by polymerase chain reaction and sequenced. The DNA may be used in sense or antisense constructs to modify gene expression in plants. The carotenoid content and related characteristics of plant parts
                                                                                                                                                                                                                                                                        Grierson Watson C;

```

This sequence represents the modified phytoene synthase gene MTOM5, which CC is also a chloroplast targeting sequence. This sequence is used in the CC method of the invention for enhancing expression of a protein by an CC organism, comprising inserting into its genome a nucleotide sequence which produces different RNA on transcription to that of the gene already present, but produces the same protein on translation. Transgenic plants CC with enhanced ability to express a selected can be produced by the CC method. For example, the method can be used to achieve overexpression of CC (especially phytoene synthase), to enhance carotenoid synthesis in plants CC (especially phytoene synthase), to enhance carotenoid expression, is enhanced CC colouration of developing tomato fruit. Protein expression is enhanced by CC inserting a gene construct which is altered by maximising the CC dissimilarity of nucleotide usage whilst maintaining identity of the construct in low or no expression (co-suppression), insertion sometimes result in low or no expression (co-suppression), especially when the recombinant and endogenous gene sequences are similar. The method allows enhanced expression whilst avoiding or reducing co-suppression, since sequence similarity between the two is sufficiently reduced. the two genes

Considered in the method of the invention. The specification describes controled for the inhibition and control of gibberellic acid levels. Considered in construct expressing a RNA or protein which constructs the pathway, or degrades gathway substrates or products. Constrate from the pathway, or degrades gathway substrates or products. Constrate from the pathway, or degrades gathway substrates or products. Constrate gene synthase, consider this. The method is used to control seed constructed to achieve this. The method is used to control seed constration, in transgenic pathway and restoration of normal seed constration, in transgenic pathway and restoration of normal seed compared to normal seed pathway and restoration of normal seed compared to normal plants. The plants produced are gibberellin compared to normal plants.

                                                                                                                                                                    The invention relates to control of gibberellin (GA) levels in plants. CC The method involves producing transgenic plants having a phenotype CC of reduced seed germination and reduced early seedling growth, then CC restoring seed germination and reduced early seedling growth, then CC plants with an appropriate compound when conditions are favourable. CC The method is useful to control seed germination and/or early seedling CC growth in agricultural production so that unfavorable environmental cc conditions normally reducing agronomic output can be avoided and CC vields increased. Plants also demonstrate increased uniformity of CC germination, emergence and seedling vigor, so increasing yields at CC cannola, soybean, cotton, etc., and is also useful in storage and CC transport of seeds to reduce premature germination which may affect CC agronomic or food quality of the seeds. The present sequence is for the invention synthase CDNA. This CDNA is used in exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Brown SM,

                                                                                                                                                                                                                                                                                                                                             Clone pTOM5 was derived from a cDNA library isolated from ripe tomato RNA (Slater et al., Plant Molecular Biology 5, 137-147, 1985). The protein it encodes is estimated to have mol. wt. ca. 48kD. pTOM5 is expressed in ripening fruit. Strongest expressio at the full orange stage of ripening; no expression is detected green fruit. See also AAQ12494. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                           Sequence 1646

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                              US-09-847-081B-2 (1-440) x AAV16951
                                                                                                                                                                             The present sequence encodes phytoene synthase 4. It was isolated from a CNNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAVL6952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes phytoene synthase 2. It was isolated from a cDNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAVL6952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.

                                                                                                                                                                   (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by
                                                                                                                                                                                                                                                                                           The invention relates to identifying a stress condition to which a plant cell has been exposed, comparising:

(a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant
